Introduction

Cloud computing has revolutionized the way applications are developed and deployed, offering scalability, flexibility, and cost-effectiveness. This PoC focuses on deploying a Python-based Flask web application on an AWS EC2 instance. Flask, a lightweight web framework, is ideal for building simple yet powerful web applications. Through this project, you will learn how to set up a virtual machine in AWS, configure it, and deploy a web application, making it accessible to users globally.

Overview

In this project, a Flask application is developed and deployed on an Amazon EC2 instance. The application runs on a cloud-hosted Linux server with an accessible HTTP endpoint. The steps include:

1. Launching an EC2 instance.
2. Configuring the instance environment (Python, Flask, and dependencies).
3. Writing a Flask web application.
4. Setting up the firewall to allow HTTP traffic.
5. Testing the application on a browser.

The PoC demonstrates a simple yet effective way to understand deploying web applications in a cloud environment.

Objectives

- 1. Understand Flask Framework:** Learn the basics of Flask and how to write a simple web application.
- 2. Cloud Deployment:** Gain hands-on experience deploying an application on AWS EC2.
- 3. Security Configuration:** Configure inbound rules in AWS to allow HTTP traffic securely.
- 4. Application Accessibility:** Ensure the application is accessible globally via a public IP.
- 5. Real-World Skills:** Develop skills in cloud computing and web application deployment.

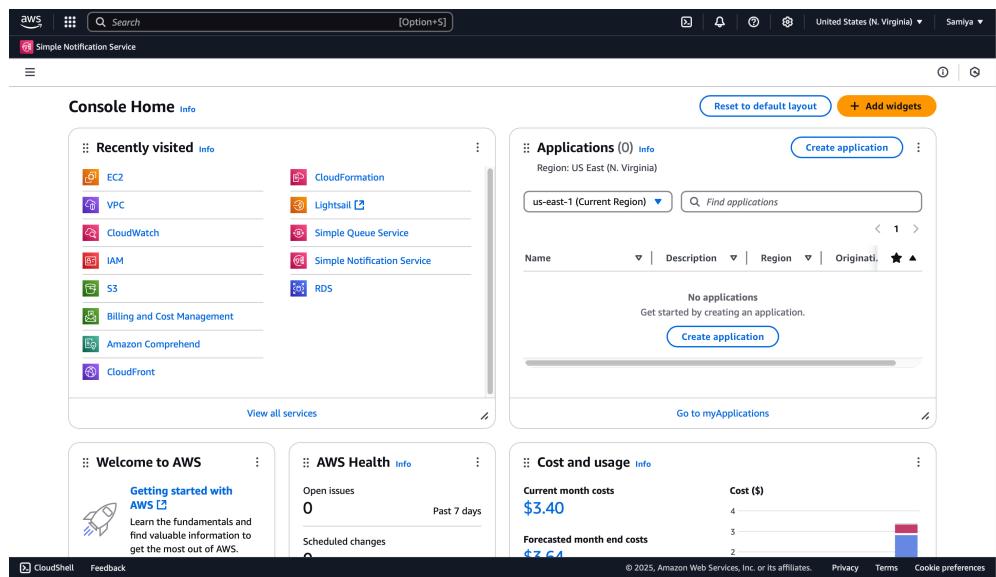

Importance

- 1. Practical Exposure:** Provides real-world experience in deploying applications to the cloud, an essential skill in modern IT infrastructure.
- 2. Skill Development:** Improves your understanding of cloud services, virtual machines, and web development.
- 3. Scalability:** Demonstrates how applications can be deployed and scaled easily using cloud infrastructure.
- 4. Career Advancement:** Builds foundational knowledge in cloud computing, a highly sought-after skill in the tech industry.
- 5. Problem-Solving:** Encourages troubleshooting skills by resolving deployment issues and configuring environments.

Step-by-Step Overview

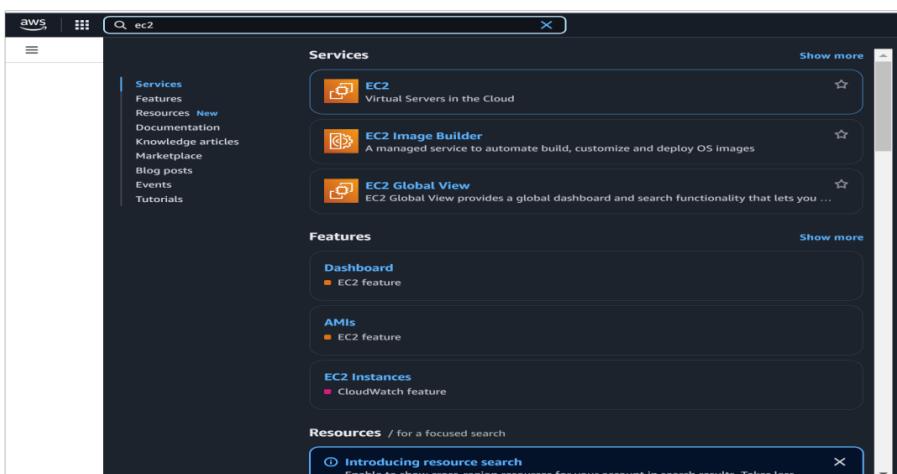

Step 1:

1. Go to [AWS Management Console](#).
2. Enter your username and password to log in.

Step 2:

On the EC2 Dashboard, click on **Launch Instances** and enter a name for your instance (e.g., "Flask Server") and select Ubuntu as OS and create a key pair. Leave other settings as default and Click **Launch Instance**.

The screenshot shows the AWS EC2 Instances page. On the left, there's a navigation sidebar with sections like Dashboard, EC2 Global View, Events, Instances (selected), Images, Elastic Block Store, and Network & Security. The main area displays a table of instances:

Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Availability Zone
Flask Server	i-0cc6b993921f9df46	Running	t2.micro	Initializing	View alarms	us-east-1c
Flask Server	i-0944144475be43e91	Shutting-d...	t2.micro	-	View alarms	us-east-1d

Below the table, a modal window titled "Select an instance" is open, showing the same list of instances.

Step 3:

Click the 'Connect' option on your launched instance, go to the SSH client section, and copy the command provided under the 'Example' section.

The screenshot shows the "Connect to instance" dialog for the instance i-09c55ff238893c328. The "SSH client" tab is selected. A message at the top says: "Connect to your instance i-09c55ff238893c328 (Flask Server) using any of these options". Below it, there are four tabs: EC2 Instance Connect, Session Manager, SSH client (selected), and EC2 serial console. The "SSH client" tab contains instructions and a command line interface. A callout bubble highlights the copied command: "ssh -i \"newkey.pem\" ubuntu@ec2-44-202-129-42.compute-1.amazonaws.com". A note at the bottom says: "Note: In most cases, the guessed username is correct. However, read your AMI usage instructions to check if the AMI owner has changed the default AMI username." A "Cancel" button is at the bottom right.

Step 4:

Open PowerShell, navigate to the 'Downloads' directory where the downloaded key pair is located using the **cd Downloads** command

Paste the command copied from the EC2 Connect's SSH client section, replace the key pair name with your downloaded key (e.g., new.pem), press Enter, and type 'yes' when prompted.

```
PowerShell 7.5.0
PS /Users/samiyaafreen> cd Downloads
PS /Users/samiyaafreen/Downloads> ssh -i "key_1.pem" ubuntu@ec2-98-82-15-247.compute-1.amazonaws.com
[The authenticity of host 'ec2-98-82-15-247.compute-1.amazonaws.com (98.82.15.247)' can't be established.
ED25519 key fingerprint is SHA256:Wljch/K8pphtBi7sKqm69UuFiAFOzzUT4aWGM5D0x70.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'ec2-98-82-15-247.compute-1.amazonaws.com' (ED25519) to the list of known hosts.

@     WARNING: UNPROTECTED PRIVATE KEY FILE!      @
@@@@@@@
Permissions 0644 for 'key_1.pem' are too open.
It is required that your private key files are NOT accessible by others.
This private key will be ignored.
Load key "key_1.pem": bad permissions
ubuntu@ec2-98-82-15-247.compute-1.amazonaws.com: Permission denied (publickey).
PS /Users/samiyaafreen/Downloads> chmod 400 key_1.pem
PS /Users/samiyaafreen/Downloads> ssh -i "key_1.pem" ubuntu@ec2-98-82-15-247.compute-1.amazonaws.com

Welcome to Ubuntu 24.04.1 LTS (GNU/Linux 6.8.0-1021-aws x86_64)
```

Step 5:

Update the Package List :

```
[ubuntu@ip-172-31-94-223:~$ sudo apt-get update
```

Step 6:

Install Python3 and pip

```
ubuntu@ip-172-31-94-223:~$ sudo apt-get install python3 python3-pip -y
```

Step 7:

Install Virtual Environment Tools : This helps keep your app's dependencies separate.

```
ubuntu@ip-172-31-94-223:~$ sudo apt-get install python3-venv -y
```

Step 8:

Create and Activate a Virtual Environment and install Flask

```
[ubuntu@ip-172-31-94-223:~$ python3 -m venv flaskenv
[ubuntu@ip-172-31-94-223:~$ source flaskenv/bin/activate
(flaskenv) ubuntu@ip-172-31-94-223:~$ pip install Flask]
```

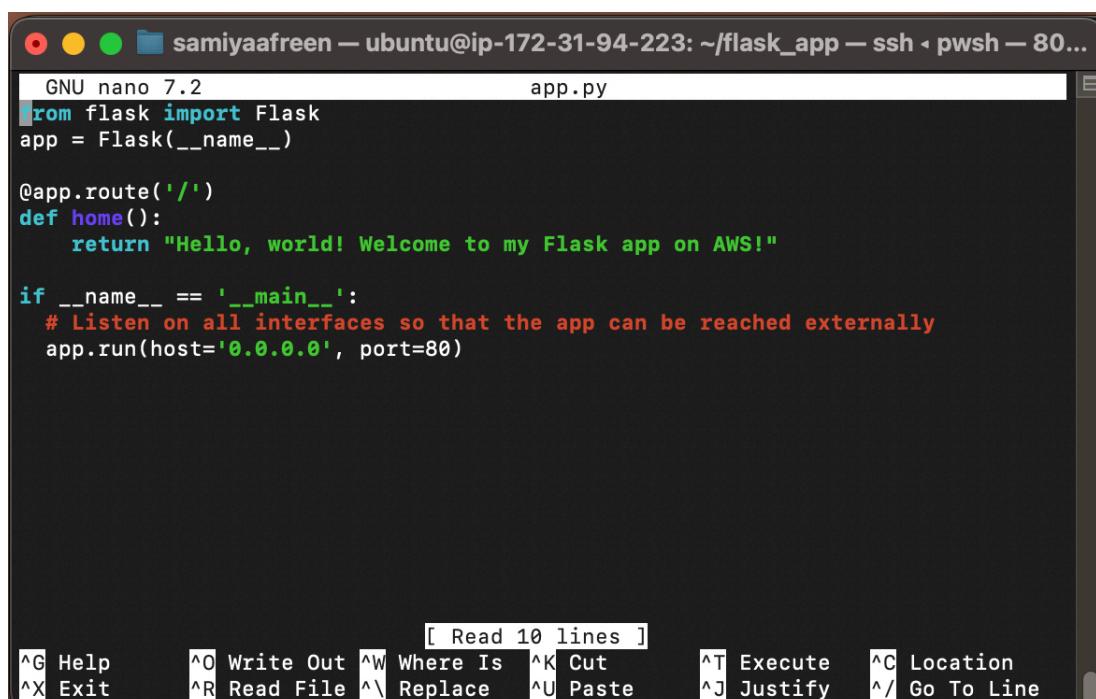

Step 9:

Create a Directory for Your App and Create a file called app.py using a text editor (like nano).

```
[(flaskenv) ubuntu@ip-172-31-94-223:~$ mkdir ~/flask_app
[(flaskenv) ubuntu@ip-172-31-94-223:~$ cd ~/flask_app
(flaskenv) ubuntu@ip-172-31-94-223:~/flask_app$ nano app.py]
```

Step 10:

Write this code into the editor and press **Ctrl + O** (to write out) and then **Enter**, then **Ctrl + X** to exit.

```
GNU nano 7.2                                     app.py
from flask import Flask
app = Flask(__name__)

@app.route('/')
def home():
    return "Hello, world! Welcome to my Flask app on AWS!"

if __name__ == '__main__':
    # Listen on all interfaces so that the app can be reached externally
    app.run(host='0.0.0.0', port=80)
```

[Read 10 lines]

^G Help **^O Write Out** **^W Where Is** **^K Cut** **^T Execute** **^C Location**
^X Exit **^R Read File** **^\\ Replace** **^U Paste** **^J Justify** **^/ Go To Line**

Step 11:

Exit the virtual environment:

```
(flaskenv) ubuntu@ip-172-31-94-223:~/flask_app$ deactivate
```

Step 12:

Add your virtual environment's Python path to the sudo command and Run the application using the virtual environment's Python:

```
[ubuntu@ip-172-31-94-223:~/flask_app$ source ~/flaskenv/bin/activate  
(flaskenv) ubuntu@ip-172-31-94-223:~/flask_app$ pip install Flask
```

Step 13:

Your Flask app is now running!

```
(flaskenv) ubuntu@ip-172-31-94-223:~/flask_app$ sudo ~/flaskenv/bin/python app.py  
* Serving Flask app 'app'  
* Debug mode: off  
WARNING: This is a development server. Do not use it in a production deployment.  
Use a production WSGI server instead.  
* Running on all addresses (0.0.0.0)  
* Running on http://127.0.0.1:80  
* Running on http://172.31.94.223:80  
Press CTRL+C to quit
```

Step 14:

Go to the **EC2 Dashboard > Instances**.

Find your instance and note the **Security Group** attached to it.

Navigate to **Security Groups** under the **Network & Security** section.

Select the Security Group associated with your EC2 instance.

Under the **Inbound Rules** tab, ensure there is a rule for **HTTP (port 80)**:

Type: HTTP

Protocol: TCP

Port Range: 80

Source: Anywhere (0.0.0.0/0, ::/0)

If there isn't an HTTP rule, click **Edit inbound rules** and add it.

The screenshot shows the AWS EC2 Security Groups interface. A new inbound rule is being created for port 80. The 'Source' is set to 'Anywhere (0.0.0.0/0, ::/0)'. The 'Type' is 'HTTP' and 'Protocol' is 'TCP'. The 'Port range' is '80'. The 'Description - optional' field is empty. A note at the bottom states: '⚠️ Rules with source of 0.0.0.0/0 or ::/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.' At the bottom, there are 'Cancel', 'Preview changes', and 'Save rules' buttons. The 'Save rules' button is highlighted in orange.

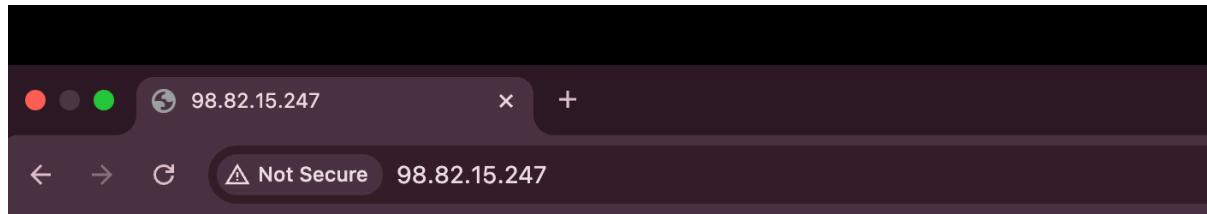

Step 15:

Open your browser and navigate to:

`http://<Your-Instance-Public-IP>/`

Replace <Your-Instance-Public-IP> with the Public IPv4 address of your EC2 instance (e.g., <http://54.123.45.67/>).

Public IPv4 address can be found in your Ec2 instance dashboard.

Outcome

By completing this PoC of deploying a Flask web application using an EC2 instance, you will:

1. Launch and configure an EC2 instance with Ubuntu as the operating system.
2. Install and configure the necessary Python environment and dependencies for the Flask framework.
3. Write a simple Flask application (`app.py`) that displays a message when accessed through a web browser.
4. Host the Flask web application on the EC2 instance and configure it to allow HTTP traffic by updating the security group rules.
5. Access your Flask web application live on the web using the EC2 instance's Public IPv4 DNS or IP address.
